

Chapter 08

SIEM

What Is a SIEM?

Collects logs from every network device

- Routers, switches, servers, endpoints, and services

One dashboard, one view

- Your “single pane of glass” for security data

Event Correlation

Correlation engine links events

- Connects related data and triggers rule-based alerts

Automated log aggregation

- No more manual collection from each device

Data Normalization

Standardizes different log formats

- Every device logs differently — the SIEM makes them consistent

Compares apples to apples

- Aligns timestamps, hostnames, and events into uniform columns

Threat Detection

Spots patterns across devices

- Identifies threats and emerging trends from log analysis

Real-time alerts

- Notifies your team when events need attention

SOAR

Scripts handle routine events

- Security Orchestration, Automation, and Response automates your playbooks

Humans step in only when needed

- Low-priority events auto-logged; breaches escalate immediately

Alert Tuning

Filter by severity

- Suppress noise; escalate high-priority incidents

Focus on what matters

- Right alerts reach the right people at the right time

Reporting and Compliance

Archives log data over time

- Historical view of all security events in your organization

Auto-generates compliance reports

- Ready for regulatory audits without manual effort
